Dual Axis Back-Folding Control System

IIS provides servo solutions for all types of automation. One of our popular packages is the servo-controlled upgrade package designed for a high speed back-folding system. Used in the box-making process to accurately form, fold and glue the flaps on the back end of cardboard sheets. The back-end folding phase for a box accommodates different size flaps and box widths.

Easy setup sequences, presented by the touchscreen HMI operator interface, provide quick changeovers and adjustments for fine-tuning the back-folding process. Product run details reside in system recipes for future recall. Diagnostic screens and status messages that alert the operator minimize loss of production.
